

Appendix E: Death Ride Deadlines The “Just-Made-It” Schedule

The Tour of the California Alps—Markleeville Death Ride is officially 129 miles and 16,000 feet of climbing. There are five major passes: The front and back sides of Monitor, the front and back sides of Ebbett’s, and Carson Pass.

Like many ACE™ rides, there are official time cut-offs.

These time cut-offs are not based on riders completing five passes. Rather, the cut-offs are based on road closures and openings.

At the Death Ride, the only official cut-offs that has relevance to riders attempting all-five passes are the cut-offs for beginning the climb up Carson Pass at Woodfords and half-way up the pass at Pickett’s Junction.

On the next page is the schedule you must keep to just finish the event.

The basis for this schedule is a climbing intensity of roughly 1,650 feet per hour, the absolute minimum for this ride. Although officially 16,000 feet, my calculations show the ride to be about 500 feet less.

Most riders on this schedule should have 30-34 gearing: a 30-tooth front chainring and a 34-tooth rear sprocket.

This schedule leaves very little time for fixing mechanical problems. It assumes you are a relatively good descender. There are only five minutes of grace time to get to Woodfords, the critical cut-off.

If you can't pace and make the early cut-off times, you are not going to make five passes. Consider slowing down, enjoying the views, and riding fewer passes.

Riders on this tight a schedule should consider leaving 20 minutes earlier or more, with lights, to have more of a buffer.

Climb Segment	Feet	Time Minutes	Feet/Hour
Turtle Rock Park South	331		
Monitor	2,632	95	1,662
Monitor	3,257	120	1,628
Ebbett’s	3,050	110	1,663
Ebbett’s	1,642	60	1,642
North	781		
Carson	3,139	160	1,177
South to Turtle Rock Park	659		
Total	15,491		

Calculation of major pass climbing segment time based on a climbing intensity of approximately 1,650 feet of climbing per hour on the first four passes. Flatter sections reduce the climbing rate on Carson Pass.

Nutritional Schedules

It is recommended that a 70-kilogram (154-pound) rider consume up to two standard water bottles per hour when riding in the heat and ingest at least 300 calories per hour. Heavier or lighter riders can proportion these recommendations.

Possible schedules to meet these nutritional needs based on Death Ride rest stops are also included in the “Just-Made-It” table on the next page.

In this schedule many of the rest stops are at the summits. By eating here you can partially digest your food on the descents. And the views are great. Bear in mind that the summits are often very busy, and food and port-potty lines may be longer.

The fluid schedule of 25 standard waterbottles is a little less than 2 bottles per hour. The caloric schedule just meets with 300 calories per hour recommendation.

You Are At	Miles		Climb		Up	Down	"Flat"	Rest/ Buffer	Elapsed Cumulative		Real Time	Possible Fluid Schedule		Possible Caloric Schedule	
	Segment	Total	Segment	Total	Minutes	Minutes	Minutes	Minutes	Minutes	Hours:Min					
Breakfast												16 Ounce Bottles			
Start Turtle Rock Park											5:30 AM			Breakfast	1,500
Monitor Turnoff	7.5	7.5	331				40		40	40	6:10 AM	2		Maltodextrin bottles	400
